	Python Module Index	9
	Index	11

A pypi demonstration vehicle.

USEFUL #1 – AUTO MEMBERS

This is something I want to say that is not in the docstring.

class `an_example_pypi_project.useful_1.MyPublicClass` (*foo, bar='baz'*)

We use this as a public class example class.

You never call this class before calling `public_fn_with_sphinx_docstring()`.

Note: An example of intersphinx is this: you **cannot** use `pickle` on this class.

get_foobar (*foo, bar=True*)

This gets the foobar

This really should have a full function definition, but I am too lazy.

```
>>> print get_foobar(10, 20)
30
>>> print get_foobar('a', 'b')
ab
```

Isn't that what you want?

`an_example_pypi_project.useful_1.public_fn_with_google_docstring` (*name,*
state=None)

This function does something.

Args: *name* (str): The name to use.

Kwargs: *state* (bool): Current state to be in.

Returns: int. The return code:

```
0 -- Success!
1 -- No good.
2 -- Try again.
```

Raises: `AttributeError`, `KeyError`

A really great idea. A way you might use me is

```
>>> print public_fn_with_google_docstring(name='foo', state=None)
0
```

BTW, this always returns 0. **NEVER** use with `MyPublicClass`.

`an_example_pypi_project.useful_1.public_fn_with_sphinx_docstring` (*name,*
state=None)

This function does something.

Parameters

- **name** (*str.*) – The name to use.
- **state** (*bool.*) – Current state to be in.

Returns int – the return code.

Raises AttributeError, KeyError

USEFUL #2 – EXPLICIT MEMBERS

This is something I want to say that is not in the docstring.

```
an_example_pypi_project.useful_2.public_fn_with_sphinx_docstring(name,  
                                                                    state=None)
```

This function does something.

Parameters

- **name** (*str.*) – The name to use.
- **state** (*bool.*) – Current state to be in.

Returns *int* – the return code.

Raises *AttributeError, KeyError*

```
an_example_pypi_project.useful_2._private_fn_with_docstring(foo, bar='baz', foo-  
                                                            barbas=None)
```

I have a docstring, but won't be imported if you just use `:members:`.

```
class an_example_pypi_project.useful_2.MyPublicClass(foo, bar='baz')
```

We use this as a public class example class.

You never call this class before calling `public_fn_with_sphinx_docstring()`.

Note: An example of intersphinx is this: you **cannot** use `pickle` on this class.

```
_get_baz(baz=None)
```

A private function to get baz.

This really should have a full function definition, but I am too lazy.

```
get_foobar(foo, bar=True)
```

This gets the foobar

This really should have a full function definition, but I am too lazy.

```
>>> print get_foobar(10, 20)  
30  
>>> print get_foobar('a', 'b')  
ab
```

Isn't that what you want?

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`

a

`an_example_pypi_project`, 3
`an_example_pypi_project.useful_1`, 3
`an_example_pypi_project.useful_2`, 5

u

`useful_1` (*Unix, Windows*), 5

Symbols

`_get_baz()` (`an_example_pypi_project.useful_2.MyPublicClass`
method), 5
`_private_fn_with_docstring()` (in module
`an_example_pypi_project.useful_2`), 5

A

`an_example_pypi_project` (module), 1
`an_example_pypi_project.useful_1` (module), 3
`an_example_pypi_project.useful_2` (module), 5

G

`get_foobar()` (`an_example_pypi_project.useful_1.MyPublicClass`
method), 3
`get_foobar()` (`an_example_pypi_project.useful_2.MyPublicClass`
method), 5

M

`MyPublicClass` (class in
`an_example_pypi_project.useful_1`), 3
`MyPublicClass` (class in
`an_example_pypi_project.useful_2`), 5

P

`public_fn_with_google_docstring()` (in module
`an_example_pypi_project.useful_1`), 3
`public_fn_with_sphinx_docstring()` (in module
`an_example_pypi_project.useful_1`), 3
`public_fn_with_sphinx_docstring()` (in module
`an_example_pypi_project.useful_2`), 5

U

`useful_1` (module), 3, 5
